

## MIST-AIR RAIN GUN SYSTEM

**Centralised base unit**

**Above or below ground circulation lines around site**

**Auto and manual operation**

A central Base Unit can supply any amount of rain gun heads with radius throws of up to 30 meters.

Smaller systems can be supplied to keep drives, roadways, and paved areas damp automatically.

Guns can be set to cover any area up to 360 degrees.

Each Rain gun is controlled individually, so any area or areas can be selected to work automatically throughout the working day, without the need for all to operate, or just one gun could operate intermittently on a crushing area for instance to keep the stock piles damp.
